Swope, Sheridan Monday, November 17, 2003 12:48 PM

To: Subject: STIC-Biotech/ChemLib

09607745

For 09607745, pls do the following searches and alignments:

#### Search:

SID 2 against the NT and AA data bases. SID 9 against the NT and AA data bases.

Align SID 2 and 9 with: **EMBL** Acc# AF179224 EMBL Acc# AF216312. EMBL Acc# Q9NRS4 GENSEQ Acc# AAY99417

#### THANKS!!!

Sheridan Swope, Ph.D. Patent Examiner, AU 1652 Recombinant Enzymes sheridan.swope@uspto.gov 703-305-1696 (voice) 703-308-3014 (FAX) Mailbox: CM1 Rm10D01 Office: CM1 Rm12D12

                                                                                               AAA37022 to AAA37144 encode the new isolated human transmembrane, receptor or secreted PRO polypeptides given in AAY99340 to AAY99462. The transmembrane and receptor PRO proteins can be used for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions. The polypeptides and nucleotide sequences encoding then have various industrial applications, including uses as pharmaceutical and diagnostic agents. AAA37145 to AAA37330 represent PCR primers and hybridisation probes used in the isolation of the PRO polypeptides from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       241
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    238
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    418
               New mammalian DNA sequences encoding transmembrane, receptor or secreted PRO polypeptides, useful for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions
                                                                                                                                                                                                                                                                                                                                                                                                                                                  121
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                123
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              181
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         178

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAA37022 to AAA37144 encode the new isolated human transmembrane, receptor or secreted PRO polypeptides given in AAY99340 to AAY99462. The transmembrane and receptor PRO proteins can be used for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions. The polypeptides and nucleotide sequences encoding then have various industrial applications, including uses as pharmaceutical and diagnostic agents. AAA37145 to AAA37330 represent PCR primers and hybridisation probes used in the isolation of the PRO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              KIVGGYALDVDSWPWQVSIQYDKQHVCGGSILDPHWVLTAAHCFRKHTDVFNWKVRAGSD 110

serine protease D-G amino acid sequence.

ine protease Seripancrin, useful for treating arthritis, chronic obstructive pulmonary disease, disorders, stroke, angiogenesis and aberrant

45pp; English

39-40;

```
The present invention relates to seripancrin polynucleotides, and polypeptides encoded by them. Seripancrin are members of serine protease family. This protein contains a transmembrane domain, a low density lipoprotein (LDL) domain, protease domain and a scavenger receptor cysteine-rich (SRCR) domain. The LDL and SRCR domains help to define the specificity of seripancrin's intra and intermolecular interactions. The polynucleotides and polypeptides of the invention are useful for treating and diagnosing diseases such as arthritis, chronic obstructive pulmonary disorder (COPD), cancer, osteoporosis, aberrant wound healing, angiogenesis, inflammatory disorders, diabetes, stroke and cardiovascular diseases. Seripancrin genes are useful in chromosome localisation studies, as tools for tissue expression studies and also in gene therapy. The polypeptides of the invention are used for identifying agonists and antagonists useful for treating conditions associated with
                                                                                                                                                                                                                                                                                                                                                                                                                                   as tools for tissue expression studies and also in gene therapy. The polypeptides of the invention are used for identifying agonists and antagonists useful for treating conditions associated with seripancrin imbalance. These polypeptides are also useful as vaccines. The present sequence is seripancrin protein. The seripancrin gene is located on human chromosome 11q22-q23.

The invention relates to an isolated and purified nucleic acid that encodes a serine protease called D-G protein. The activity of the protein of the invention may be described as cytostatic, antiinflammatory, dermatological and anticoagulation. The serine protease of the invention is a member of the trypsin/chymotrypsin-like (S1) serine protease family, which play an important role in processes such as digestion and regulatory amplification cascades through the proteclytic activation of regulatory amplification escades through the proteclytic activation of inactive zymogen precursors. Protease D-G modulating compounds are useful for treating a condition which is mediated by protease D-G, e.g. cancer, skin disorders, neuropathic pain, inflammatory disorders, or coagulation diathesis/thrombosis. The polynucleotide encoding the protease is useful for identifying modulators of the functional protease. The D-G protein can be used for formulation of compositions for laundry detergents and skin care products. Protease D-G gene therapy may be used to introduce protease D-G into the cells of target organisms. As the D-G protein is servived from a human, it is less likely to produce an allergic reaction in sensitive individuals when used current sequence represents the human serine protease D-G amino acid 202..203 - residues spanning the zymogen cleavage site" i S Nucleic acid encoding a serine protease called D-G protein which useful for identifying modulators that are useful for treating a condition which is mediated by protease D-G, e.g. cancer, skin disorders, or neuropathic pain -31..52 /note= "hydrophobic transmembrane domain" 'note= "catalytic triad residue" residue" /note= "catalytic triad 361 385 /note= "catalytic triad "Encoded by CTG" <u>ц</u> Jocation/Qualifiers Andrade-Gordon Claim 13; Fig 1B; 81pp; English.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   360
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   420
                                                                                                                                                                The invention describes a purified polypeptide, which comprises a fragment of a kinase, phosphatase, protease, protease inhibitor, transporter, cytoskeletal protein, receptor or transcription factor. The polypeptide is useful as an immunogenic composition for eliciting in a mammal an immunogenic response directed against any of the purified polypeptide, or the antibody that binds to this polypeptide, is useful for treating cancer. The polypeptide is also useful for identifying compounds that binds to a naturally processed class I or class II MHC-binding polypeptide. The polypeptides and polynucleotides are particularly useful for treating or preventing myeloma, colon cancer, gastric cancer, adenocarcinoma, sarcoma, melanoma, lymphoma or leukaemia. These are also useful for screening agents for treating the above mentioned diseases. This sequence represents an expressed protein tag (BPT) isolated from human tissue for translational
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                420
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Note: This sequence does not appear in the printed specification but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
           cytoskeletal proteins, receptors or transcription factors), useful for treating cancer, e.g. colon cancer, gastric cancer, sarcoma, lymphoma or leukemia

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention describes a purified polypeptide, which comprises a fragment of a kinase, phosphatase, protease, protease inhibitor, transporter, cytoskeletal protein, receptor or transcription factor. The polypeptide is useful as an immunogenic composition for eliciting in a mammal an immunogenic response directed against any of the purified polypeptide. The purified polypeptide, or the antibody that binds to this polypeptide, is useful for treating cancer. The polypeptide is also useful for identifying compounds that binds to a naturally processed class I or class II MHC-binding polypeptide. The polypeptides and polynucleotides are particularly useful for treating or preventing myeloma, colon cancer, gastric cancer, adenocarcinoma, sarcoma, melanoma, lymphoma or leukaemia. These are also useful for screening agents for treating the above mentioned diseases. This sequence represents an expressed protein tag (EPT) isolated from human tissue for translational
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       60
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             9
                                                                                                                                                                                                                                                                                              The present sequence represents novel human protease HUPM-6, as deduced from the consensus sequence (see AAX87154) of overlapping cDNA clones obtained from various libraries. Northern analysis shows expression of HUPM-6 in gastrointestinal, and male and female reproductive cDNA libraries. Approximately 65% of these libraries are associated with neoplastic disorders, and 22% with the immune response. The invention provides 12 new human proteases, i.e. HUPM-1 to -12 (see AAX87149-60). Also provided are polynucleotides encoding them (see AAX87149-60). Also provided are vectors, host cells and methods for producing HUPM polypeptides, as well as agonists and antagonists of HUPM. Methods for treating or preventing cell proliferative disorders and immune disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CDGELDCPLGEDEEHCVKSFPEGPAVAVRLSKDRSTLQVLDSATGN

The invention describes a purified polypeptide, which comprises a fragment of a kinase, phosphatase, protease, protease inhibitor, transporter, cytoskeletal protein, receptor or transcription factor. The polypeptide is useful as an immunogenic composition for eliciting in a mammal an immunogenic response directed against any of the purified polypeptide, or the antibody that binds to this polypeptide, is useful for treating cancer. The polypeptide is also useful for identifying compounds that binds to a naturally processed class I or class II MHC-binding polypeptide. The polypeptides and polynucleotides are particularly useful for treating or preventing and polynucleotides are particularly useful for treating or preventing myeloma, colon cancer, gastric cancer, adenocarcinoma, sarcoma, melanoma, I myeloma or leukaemia. These are also useful for screening agents for treating the above mentioned diseases. This sequence represents an expressed protein tag (BPT) isolated from human tissue for translational
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Note: This sequence does not appear in the printed specification but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New polypeptides (e.g. kinases, phosphatases, proteases, transporters, cytoskeletal proteins, receptors or transcription factors), useful for treating cancer, e.g. colon cancer, gastric cancer, sarcoma, lymphoma or leukemia -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The sequences given in AAG79356-59 show the colorectal cancer proteins, CGA7 and CJA8 proteins are colorectal cancer modulating proteins and have been mapped to chromosomes 2 (CGA7) and 11 (CJA8). These sequences may be used in the method of the invention for screening drug candidates. The method comprises adding a drug candidate to a cell that expresses an expression profile gene correction for screen bloadtive agents for the ability to bind to drug candidate on the expression of the expression profile gene. The new methods are used to screen bloactive agents for the ability to bind to candidate colorectal cancer drug. An antibody to CGA7 or CJA8 can inhibit the activity of CGA7 or CJA8, respectively, and is used to screen for an agent that can interfere with the binding of CGA7 or CJA8 to the activity of CGA7 or CJA8, respectively, and is used to screen for an agent that can interfere with the binding of CGA7 or CJA8 to the activity of CGA7 or CJA8 is used to inhibit colorectal cancer tissue, where the therapeutic group is a cytotoxic agent or a radioisotope. Antisense molecules are used to inhibit colorectal cancer in a cell. Nucleic acid segments encoding CGA7 or CJA8 are used to alicit an immune response. CGA7 or CJA8 is used to clorectal cancer.

Nucleic acid encoding CGA7 or CJA8 can be used to water the prognosis of an individual with colorectal cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          183

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention describes a purified polypeptide, which comprises a fragment of a kinase, phosphatase, protease, protease inhibitor, transporter, cytoskeletal protein, receptor or transcription factor. The polypeptide is useful as an immunogenic composition for eliciting in a mammal an immunogenic response directed against any of the purified
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New polypeptides (e.g. kinases, phosphatases, proteases, transporters, cytoskeletal proteins, receptors or transcription factors), useful for treating cancer, e.g. colon cancer, gastric cancer, sarcoma, lymphoma

                                                                                                                                                                                                                                                                                                                                                             ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention describes a purified polypeptide, which comprises a fragment of a kinase, phosphatase, protease, protease inhibitor, transporter, cytoskeletal protein, receptor or transcription factor. The polypeptide is useful as an immunogenic composition for eliciting in a mammal an immunogenic response directed against any of the purified polypeptide, or the antibody that binds to this polypeptide, is useful for treating cancer. The polypeptide is also useful for identifying compounds that binds to a naturally processed class I or class II MHC-binding polypeptide. The polypeptides and polynucleotides are particularly useful for treating or preventing myeloma, colon cancer, gastric cancer, adenocarcinoma, sarcoma, melanoma, lymphoma or leukaemia. These are also useful for screening agents for treating the above mentioned diseases. This sequence represents an expressed protein tag (EPT) isolated from human tissue for translational
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        123
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                121

polypeptide. The purified polypeptide, or the antibody that binds to this polypeptide, is useful for treating cancer. The polypeptide is also useful for identifying compounds that binds to a naturally processed class I or class II MHC-binding polypeptide. The polypeptides and polynucleotides are particularly useful for treating or preventing myeloma, colon cancer, gastric cancer, adenocarcinoma, sarcoma, melanoma, lymphoma or leukaemia. These are also useful for screening agents for treating the above mentioned diseases. This sequence represents an expressed protein tag (BPT) isolated from human tissue for translational profiling.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          421

The invention describes a purified polypeptide, which comprises a fragment of a kinase, phosphatase, protease, protease inhibitor, correspondent of transporter, cytoskeletal protein, receptor or transcription factor.

CC transporter, cytoskeletal protein, receptor or transcription factor.

The polypeptide is useful as an immunogenic composition for eliciting in a mammal an immunogenic response directed against any of the purified polypeptide. The purified polypeptide, or the antibody that binds to this polypeptide, is useful for treating cancer. The polypeptide is also useful for treating compounds that binds to a naturally processed class I or class II MHC-binding polypeptide. The polypeptides and polynucleotides are particularly useful for treating or preventing myeloma, colon cancer, gastric cancer, adenocarcinoma, sarcoma, melanoma, clymphoma or leukaemia. These are also useful for screening agents for treating the above mentioned diseases. This sequence represents an priling.

C expressed protein tag (BPT) isolated from human tissue for translational priling.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               121

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention describes a purified polypeptide, which comprises a fragment of a kinase, phosphatase, protease inhibitor, transporter, cytoskeletal protein, receptor or transcription factor.

The polypeptide is useful as an immunogenic composition for eliciting in a mammal an immunogenic response directed against any of the purified polypeptide, or the antibody that binds to this polypeptide, is useful for treating cancer. The polypeptide is also useful for identifying compounds that binds to a naturally processed class I or class II MHC-binding polypeptide. The polypeptides and polynucleotides are particularly useful for treating or preventing myeloma, colon cancer, gastric cancer, adenocarcinoma, sarcoma, melanoma, lymphoma or leukaemia. These are also useful for screening agents for treating the above mentioned diseases. This sequence represents an expressed protein tag (EPT) isolated from human tissue for translational

                                                                                                                                                                                                                                                                                                                                                                                                                         eripancing gness are useful in chromosome localisation studies, as tools for tissue expression studies also in gene therapy. The polypeptides of the invention are used for identifying agonists and antagonists useful for treating conditions associated with seripancin imbalance. These polypeptides are also useful as vaccines. The present sequence is seripancin variant #1 protein. The seripancin gene is located on human chromosome 11q22-q23.
                                                                                                                                                                                    polypeptides encoded by them. Seripancian polynucieculass, and protease family. This protein contains a transmembrane domain, a low density lipoprotein (LDL) domain, protease domain and a scavenger receptor cysteine-rich (SRCR) domain. The LDL and SRCR domains help to define the specificity of seripancial's intra and intermolecular interactions. The polynucleotides and polypeptides of the invention are useful for treating and diagnosing diseases such as arthritis, chronic obstructive pulmonary disorder (COPD), cancer, osteoporosis, aberrant wound healing, angiogenesis, inflammatory disorders, diabetes, stroke and cardiovascular diseases. Seripancin genes are useful in chromosome localisation studies,
   Seripancrin, useful for treating

```
The invention describes a purified polypeptide, which comprises a fragment of a kinase, phosphatase, protease, protease inhibitor, transporter, cytoskeletal protein, receptor or transcription factor. The polypeptide is useful as an immunogenic composition for eliciting in a mammal an immunogenic response directed against any of the purified polypeptide, or the antibody that binds to this polypeptide. The purified polypeptide, or the antibody that binds to this polypeptide, is useful for treating cancer. The polypeptide is also useful for identifying compounds that binds to a naturally processed class I or class II MHC-binding polypeptide. The polypeptides are particularly useful for treating or preventing myeloma, colon cancer, gastric cancer, adenocarcinoma, sarcoma, melanoma, lymphoma or leukaemia. These are also useful for screening agents for treating the above mentioned diseases. This sequence represents an expressed protein tag (BPT) isolated from human tissue for translational profiling.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       specification but was

The polypeptide is useful as an immunogenic composition for eliciting in a mammal an immunogenic response directed against any of the purified polypeptide. The purified polypeptide, or the antibody that binds to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          kinases, phosphatases, proteases, transporters, receptors or transcription factors), useful for colon cancer, gastric cancer, sarcoma, lymphoma

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       420
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    420
this polypeptide, is useful for treating cancer. The polypeptide is also useful for identifying compounds that binds to a naturally processed class I or class II MHC-binding polypeptide. The polypeptides and polynucleotides are particularly useful for treating or preventing myeloma, colon cancer, gastric cancer, adenocarcinoma, sarcoma, melanoma, lymphoma or leukaemia. These are also useful for screening agents for treating the above mentioned diseases. This sequence represents an expressed protein tag (EPT) isolated from human tissue for translational profiling.
                                                                                                                                                                                                                                                                                                                                             9
                                                                                                                                              Note: This sequence does not appear in the printed specification but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

The invention relates to transmembrane serine proteases and their corresponding nucleotides and the protease domain of a type-II membrane-type serine protease (MTSP). MTSP is useful for identifying compounds that modulate or inhibits its proteolytic activity and for formulating a medicament for treating neoplastic disease. MTSP and its corresponding nucleotides are useful in preventing or treating tumours or cancers such as lung carcinoma, colon adenocarcinoma and ovarian carcinoma, in diagnostics and in hybridisation assays. MTSP is useful as a diagnostic marker for tumour development, growth and/or progression and as immunogens to generate antibodies that specifically bind to it. MTSP DNA is useful in a yeast two-hybrid system and in gene therapy. The present sequence is human MTSP3 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                 DPDSDQPLNSLDVKPLRKPRIPMETFRKVGIPIIIALLSLASIIIVVVLIKVILDKYYFL

Application US/09261416A
Patent No. 6291663
GENERAL INFORMATION:
APPLICANT: O'Brien, Timothy J.
APPLICANT: Underwood, Lowell J.
ITILE OF INVENTION: TADG-12: A No. 6291663el Transmembrane Serine Protease
TITLE OF INVENTION: Overexpressed in Ovarian Carcinoma
FILE REFERENCE: D6192
CURRENT APPLICATION NUMBER: US/09/261,416A
CURRENT FILING DATE: 1999-03-03
NUMBER OF SEQ ID NOS: 14
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    nucleotides
